

Presentation Script: Temporary Rental Space Management System

Slide 1: Title Slide

- **Paniti:** "Good morning, respected examining committee: Dr. Surapong, Dr. Paweena, and Dr. Khwunta. My name is Paniti Konngoen, and my partner is Prathanakorn Piti. Today, we are proud to present our Computer Engineering project proposal titled 'Temporary Rental Space Management System of MFU'."

Slide 2: INTRODUCTION

- **Prathanakorn:** "To start with our background, room reservation management is an essential service for sharing classrooms, meeting rooms, and activity spaces across the university. However, the traditional paper-based methods we currently use often lead to scheduling conflicts and make it difficult to track room usage effectively. By leveraging web technologies, our solution will provide real-time availability, reduce administrative workload, and improve overall accessibility for everyone on campus."

Slide 3: PROJECT OBJECTIVES

- **Paniti:** "Our project has three core objectives. First, to formally develop a web-based room reservation system for Mae Fah Luang University. Second, to enable all users to easily view available times and submit reservation requests entirely online. And third, to provide the university's administrators with dedicated tools to manage these rooms and efficiently handle booking requests."

Slide 4: SCOPE OF WORK

- **Prathanakorn:** "Looking at the scope of our system, we have designed features for two main groups. For general users—which includes internal MFU staff, external organizations, and collaborative groups—the system allows them to check available dates, submit requests with their purpose, view their history, and cancel if needed."
- **Paniti:** "On the other hand, the system equips administrators with a comprehensive dashboard. They can manage the room inventory, approve or disapprove incoming requests, and generate expense reports. Crucially, the system will also support official workflows, allowing admins to attach executive approval files directly to a booking."

Slide 5: PROJECT TIMELINE

- **Prathanakorn:** "This is our working timeline, following a structured software development life cycle. We are currently completing our proposal preparation and defense. Moving forward, we will dive into system analysis and design before our Senior Project 1 examination. The second half of the year will be dedicated to full system development, rigorous testing, and evaluation, culminating in our final Senior Project 2 defense."

Slide 6: RESOURCES REQUIRED

- **Paniti:** "To bring this system to life, our required resources include standard hardware setups with stable internet connections. For our software stack, we will develop the system using modern frameworks like Vue.js and Node.js, supported by a PostgreSQL database. To populate the system, we will utilize the MFU room inventory dataset."

Slide 7: EXPECTED RESULTS *(Previously Benefits and Impact)*

- **Prathanakorn:** "Ultimately, our expected result is to deliver a fully functional, web-based room reservation system tailored for MFU. We anticipate this platform will allow users to reserve rooms with maximum convenience while heavily improving the accuracy and efficiency of the university's facility management."

Slide 8: CONCLUSION AND Q&A

- **Paniti:** "In conclusion, this project aims to replace outdated manual processes with a streamlined, centralized online platform. By doing so, we can prevent scheduling conflicts and make facility management seamless for both users and staff. This brings us to the end of our presentation."

Slide 9: THANK YOU

- **Paniti:** "Thank you very much for your time and your attention. We would now like to open the floor to the committee for any questions, feedback, or suggestions you might have for our project."
